

Paired differences across all trained models

SUPPLEMENTAL RE-RENDER | Published v2 aggregates | 16,255 test records | 1,000 paired bootstrap replicates

All six pairs and five declared metrics. Hollow markers: estimates. Bars: conditional 95% paired cluster-bootstrap percentile intervals. Clusters are identical raw predictor profiles. Intervals condition on fitted models and this reused test sample; training variability is excluded. A difference of 0.01 is one percentage point for accuracy, balanced accuracy, and recall; it is 0.01 score units for ROC AUC and average precision. Intervals are not adjusted for multiple comparisons. A zero-crossing interval is not evidence of equivalence.
